MENTORQUE | RESUME BLUEPRINT

Software Development • Cloud Engineering • SDE / SWE

PART 1 — GENERAL RESUME GUIDELINES

1.1 The Non-Negotiables

- One page — always. The only exception is 8+ years of directly relevant, non-repetitive experience. Two pages is a privilege, not a default.
- Font: Calibri, Arial, or Garamond. Size 10–11 pt for body; 13–14 pt for name. Never decorative, never Comic Sans.
- Margins: 0.5"–0.75" on all sides. Below 0.5" signals desperation; above 1" wastes space.
- Send as PDF every time — unless the employer explicitly asks for .docx. PDF locks formatting across all devices and OS.
- File name: FirstName_LastName_Role_Resume.pdf. Never 'CV_final_v4_USE THIS.pdf'.
- Zero photos, zero graphics, zero icons, zero borders — unless you are submitting a design portfolio where visual sense IS the work product.
- Never write 'References available upon request'. Every recruiter knows. It wastes a full line.
- No 'I', 'my', or 'we' anywhere. Every line starts with an action verb or a strong noun phrase.
- Consistent tense: current role in present tense, all previous roles in past tense. Mixing tenses signals carelessness.

1.2 Appearance & Alignment

- Every section heading must look identical — same font size, same weight, same color. Inconsistency implies you cut-and-pasted from multiple templates.
- Dates are always right-aligned on the same line as company or institution. Never on a separate line below.
- White space is a design tool — 4–6 pt spacing between bullets, 10–14 pt between sections. A dense page is unreadable at a 6-second glance.
- Bold only four things: company/institution names, your job titles, degree names, and critical technology names used as anchors in experience bullets. Bold is not emphasis — it is scannability.
- All bullet points at the same left indent — misalignment is the first thing a recruiter's eye catches.
- Left-align all body text. Full justification creates uneven word spacing that reduces readability on screen.
- Use one bullet style throughout: round bullet or em-dash. Never arrows, checkmarks, or stars in the body.

1.3 Section Order

- Standard order: Contact Information → Professional Summary → Skills & Technical Expertise → Work Experience → Education → Certifications → Projects / Publications (if applicable).
- 0–2 years experience: Education may come before Work Experience. Beyond that, experience leads.
- Only include a section if you can fill it with quality content. A thin 'Awards' section with one entry from 2015 hurts more than it helps.
- Hobbies/Interests: include only if they are directly relevant (e.g., open-source contributor, published researcher, competitive coder on Codeforces).

1.4 ATS Compatibility

- ATS (Applicant Tracking System) scans your resume before any human sees it. Most companies above 50 employees use one. If the ATS can't parse you, no human ever reads you.
- Never put contact info, job titles, or skills inside headers, footers, or text boxes — ATS parsers skip them entirely.
- Avoid multi-column layouts unless you're certain of the application channel. Two-column resumes frequently parse out of order in ATS.
- Spell out acronyms on first use: 'Natural Language Processing (NLP)'. ATS matches strings — 'NLP' and 'Natural Language Processing' are different strings.

- Mirror keywords from the job description exactly: if the JD says 'stakeholder management', don't write 'stakeholder engagement' — ATS won't equate them.
- Use standard section labels: 'Work Experience', 'Education', 'Skills'. Creative headers like 'My Journey' or 'What I've Built' confuse parsers.
- No images, charts, tables (for skills), or graphical skill bars — all render as blank or garbled in ATS.

1.5 Contact Section

- Line 1: Full name in the largest font on the page (13–16 pt, bold). This is the one place size hierarchy is non-negotiable.
- Line 2: Phone | Professional Email | City, Country | LinkedIn URL | GitHub / Portfolio (if applicable).
- Email must be professional: firstname.lastname@gmail.com. Anything with nicknames, numbers, or old university handles damages credibility before the recruiter reads a single line.
- LinkedIn URL: customize it to linkedin.com/in/firstname-lastname. The default alphanumeric string looks unfinished.
- City and country only — no street address. Nobody mails you an offer letter.
- No date of birth, no marital status, no nationality, no photograph — unless you are applying in a region where this is legally required (e.g., certain MENA or European markets).

PART 2 — PROFESSIONAL SUMMARY

2.1 What It Is & Why It Matters

- The recruiter spends 6–10 seconds on first scan. The summary is the only section guaranteed to be read in that window — it decides whether the rest gets read at all.
- It is NOT an objective statement ('Seeking a challenging role where I can grow'). That phrasing is pre-2000s and signals no self-awareness.
- Think of it as a compressed pitch: who you are at your professional peak, the most valuable thing you have done, and the direction you are headed.
- Tailored to every role. A generic summary is the single biggest wasted opportunity on a resume. If your summary reads the same for 10 different jobs, it's working for none of them.
- Length: 3–4 lines, always. Two lines is too thin; five lines is an essay.

2.2 The Formula

LINE 1 — Identity: [X years] + [role/title] + [domain/industry] + [2 defining strengths]

LINE 2 — Proof: One concrete achievement with a number, scale, or named outcome. This is your hook.

LINE 3 — Direction: What problem you solve best + the kind of team/environment where you generate most value.

- Line 1 establishes your category. Recruiters think in buckets — make it instantly clear which bucket you belong in.
- Line 2 is your proof point. One strong metric beats five vague claims. If you have no metric yet, use scope: team size, user base, budget, geography.
- Line 3 is forward-facing. It tells the recruiter you have a perspective on your work — not just a job history.
- Strip every cliché: 'hardworking', 'team player', 'passionate', 'detail-oriented', 'results-driven'. These words appear on 90% of resumes and add zero signal.
- Read it aloud. If any sentence sounds like a brochure, rewrite it in plain human language.

PART 3 — EDUCATION

3.1 Format

Degree, Major | Institution Name **Month Year**

GPA: X.X / 4.0 (include only if 3.5+ or distinction equivalent) | Honors / Scholarship (if notable)

- Degree and major first, institution second, graduation year right-aligned — always in this order.
- Include GPA only when it is a genuine strength: 3.5+/4.0, 8.5+/10, First Class, or Distinction. A middling GPA draws attention to a gap. Omit it; recruiters do not ask.
- Honors and scholarships: include when notable — 'Dean's List (4 semesters)', 'National Merit Scholar', 'Full Government Scholarship'. One-time, small-scale awards from 10 years ago: leave off.
- Relevant Coursework: use only for freshers or career changers bridging a technical gap. Maximum 5 courses. Format as a comma-separated inline list, not bullets.
- For experienced professionals (5+ years): education is 2–3 lines max. No coursework, no grade details. Your work speaks louder.
- Multiple degrees: most recent first. Omit high school once you have a college degree (unless you went to an institution where it carries signal, e.g., certain international prep schools).
- Bootcamps, MOOCs, and online credentials belong in Certifications, not Education — unless the bootcamp IS your primary qualification.

PART 4 — CERTIFICATIONS & CREDENTIALS

4.1 Format & Rules

Certification Name | Issuing Body | Year (add 'In Progress' if pending)

- Only list industry-recognized credentials. A Udemy certificate is a course completion, not a certification. The distinction matters to technical recruiters.
- Maximum 4–5 certifications. If you have 12, list the 4 most recent and most role-relevant. A wall of certifications reads as credential-collecting, not expertise.
- Never list 'Microsoft Office Specialist' or 'Google Digital Garage' on a senior resume — they imply a skills floor, not a ceiling.
- Certifications in progress: include them — 'AWS Solutions Architect Associate (In Progress, Expected Jun 2025)' — they demonstrate direction and initiative.
- Expiry dates: include only in regulated fields (e.g., PMP renewal, security clearances, medical/legal credentials). Otherwise, the year of issue is sufficient.

PART 5 — TAILORING, SUBMISSION & FINAL CHECKS

5.1 Tailoring for Every Application

- Read the job description twice. First pass: understand the role. Second pass: extract the top 6–8 required skills, tools, and outcomes.
- Mirror JD language in your summary, skills, and top 2–3 bullets. Not paraphrased — exact terms. ATS matches strings.
- Reorder your skills section so the most JD-relevant category appears first.
- Swap in 1–2 role-specific bullets you have prepared in a 'backup bullet bank' — a separate document where you keep 3–5 additional bullets per role that didn't fit the one-page constraint.
- Rewrite your summary for every application. This is 10 minutes of work. It is also the single highest-ROI activity in job searching.
- Time investment per application: 15–20 minutes of tailoring is the difference between a 2% and a 25% response rate.

5.2 The 10-Second Scan Test

- Open your resume. Set a 10-second timer. Look at it fresh. What registers immediately?
- Your name, current title, and most recent company should be instantly legible without searching.
- At least one metric (%, $, scale) should be visible in the first 3 bullets of work experience without zooming.
- If the page looks like a grey block of text — restructure. More white space, shorter bullets, bolder company names.
- Have one person who doesn't know your career history read it for 10 seconds and tell you what you do. If they can't, the summary and top section need rewriting.

5.3 Pre-Submission Checklist

- ✓ One page (or genuinely justified two pages for 8+ year profiles).
- ✓ No typos — spell-check and then manually read every line, top to bottom.
- ✓ Consistent tense: present for current role, past tense for all previous roles.
- ✓ Every bullet leads with an action verb. Zero instances of 'Responsible for' or 'Worked on'.
- ✓ Every bullet contains at least one quantifier or meaningful scope qualifier.
- ✓ Date format consistent throughout (e.g., 'Jan 2022' — not mixing 'January 2022' and '01/22').
- ✓ LinkedIn URL is customized and the profile is live and complete.
- ✓ PDF opens correctly and maintains formatting on both desktop and mobile.
- ✓ File named: FirstName_LastName_Resume.pdf.
- ✓ Top 6 keywords from the target JD appear naturally in the resume.

5.4 Universal Resume Mistakes

✗ Stop Doing This	✓ Do This Instead
Objective statement: 'Seeking a challenging role where I can grow'	3-line tailored summary: title + proof metric + direction
Skill bars, star ratings, or proficiency percentages	Grouped skill categories, clean comma-separated list
'Responsible for managing...' / 'Worked on...'	Strong past-tense action verb + specific outcome
Duties listed without a single outcome or result	STAR-format bullets: action + scope + quantified result
No numbers anywhere — no %, $, time saved, or scale	Every role has at least one number: revenue, %, users, time
Identical resume sent to every job application	15-minute tailored version per application, every time
Three-page resume with two years of experience	1 tight, dense, high-signal page — 2 only if truly warranted
'References available upon request' — wastes space	Remove it entirely — it occupies prime real estate
Soft skills section: 'Teamwork, Communication, Leadership'	Let the bullets prove soft skills — never claim them
Random bold text used for emphasis instead of scannability	Bold only: company names, job titles, key tech anchors

PART 6 — PROFESSIONAL SUMMARY (SDE / SWE / Cloud)

6.1 What Recruiters Look For in an SDE Summary

- Stack clarity: what languages and systems do you live in? Recruiters scan for their required tech in the first sentence.
- Scale signal: how large were the systems you built or maintained? Users, requests/day, data volume, or team size.
- Impact framing: performance gains, reliability improvements, or shipping velocity — not just 'built features'.
- Seniority signal: junior resumes show 'built X using Y'; senior resumes show 'designed, scaled, and owned X serving Y'.

6.2 Summary Formula for SDE / Cloud

> [X-year] [role: Backend/Full-Stack/Cloud/Platform Engineer] with expertise in [primary stack: language + framework + infra].
>
> [Strongest achievement: what you built/optimized + measurable outcome: latency %, uptime, cost, users served].
>
> Focused on [system design area: distributed systems / reliability / developer productivity] for [team type: product-led / infra / platform] teams.

6.3 Worked Examples (Model Summaries)

Junior / New Grad SWE (0–2 years)

> Software Engineer with 1.5 years of experience building REST APIs and microservices in Python and Go, deployed on AWS. Shipped a real-time notification service handling 300K events/day that reduced customer response time by 28%. Interested in distributed systems and backend infrastructure at product-scale teams.

Mid-Level Full-Stack Engineer (3–5 years)

Full-Stack Engineer with 4 years building high-traffic web applications using React, Node.js, and PostgreSQL on GCP. Redesigned a payment checkout flow that reduced drop-off by 34% and increased GMV by $1.2M in the first quarter post-launch. Experienced in leading 3–4 engineer squads through full delivery cycles from RFC to production.

Senior Backend / Cloud Engineer (6+ years)

Senior Backend Engineer with 7 years designing and operating distributed systems in Java and Kotlin on AWS. Architected an event-driven data pipeline processing 8TB/day with 99.98% uptime, eliminating $120K/year in legacy infrastructure costs. Specialize in high-throughput systems, reliability engineering, and growing 0-to-senior engineers.

Cloud / DevOps / Platform Engineer (4+ years)

Cloud Platform Engineer with 5 years building and maintaining production Kubernetes infrastructure on AWS and GCP for 40+ engineering teams. Reduced average deployment cycle time from 45 minutes to 8 minutes through automated CI/CD pipelines (GitHub Actions + ArgoCD), enabling 6x increase in weekly release frequency. Deep expertise in IaC (Terraform), observability (Datadog, Prometheus), and incident management.

PART 7 — SKILLS & TECHNICAL EXPERTISE (SDE / Cloud)

7.1 How to Structure the Skills Section

- Group into clearly labeled categories. The goal is that a recruiter scanning in 3 seconds can immediately locate the skill they're looking for.
- Sequence categories by weight: your core technical stack first, then adjacent skills, then tooling. If the JD prioritizes Cloud, put Cloud first.
- Within each category, lead with the tool you're strongest in — not alphabetically.
- Only list skills you can be interviewed on deeply. A coding test or technical screen will probe everything on this list.
- Remove implied skills: 'Git', 'VS Code', 'Chrome DevTools' are baseline expectations and waste valuable space on senior resumes. Include them only at entry level.
- No proficiency levels (Beginner/Advanced bars, percentages). They are subjective and ATS ignores them. The depth of your bullets proves proficiency.

7.2 Category Guide for SDE / SWE

Languages: Python, Java, Go, TypeScript, Rust (list primary first)
Frontend: React, Next.js, Vue, Tailwind CSS, Redux, GraphQL (client)
Backend: Node.js, FastAPI, Spring Boot, Django, gRPC, REST, GraphQL (server)
Databases: PostgreSQL, MySQL | MongoDB, DynamoDB, Redis, Cassandra
Cloud & Infra: AWS (EC2, Lambda, S3, RDS, SQS, EKS), GCP, Azure
DevOps / IaC: Docker, Kubernetes, Terraform, Helm, ArgoCD, GitHub Actions
Observability: Datadog, Prometheus, Grafana, OpenTelemetry, PagerDuty
Testing: Jest, PyTest, Selenium, Postman, k6 (load testing)

- For cloud roles: specify the cloud provider and the exact services, not just 'cloud'. 'AWS (EC2, Lambda, RDS, SQS)' is a skill; 'cloud' is a category.
- For full-stack roles: clearly separate frontend and backend — recruiters use these to filter.
- For ML/AI-adjacent SWE roles: add 'ML Frameworks: PyTorch, TensorFlow, HuggingFace, LangChain' as a separate category.

PART 8 — WORK EXPERIENCE (SDE / Cloud)

8.1 Role Header Format

Software Engineer | Company Name (Series B SaaS, 150 employees) **Jan 2022 – Present**
City, Country (or 'Remote')

- Add company context in parentheses if the company is not well-known: stage (Series B), sector (fintech), and size (150 employees). One line, parenthetical.
- Most recent role: 4–5 bullets. Previous roles: 2–3 bullets. Roles older than 7 years: 1–2 bullets or consider removing.
- Promote to top: the one bullet from each role that most directly mirrors the JD you're targeting.

8.2 The Impact Bullet Framework

STRUCTURE: [Action Verb] + [What + How (technical specifics)] + [Result with metric]

EXAMPLE: Redesigned + the authentication service (Node.js + Redis session store) + cutting P95 login latency from 1.8s to 340ms for 800K MAU.

8.3 The Four Metric Dimensions for SDE

- PERFORMANCE: Latency (P50/P95/P99), throughput (req/sec, events/day), error rate (%), uptime (99.9% → 99.99%). These are the most credible engineering metrics.
- SCALE: Users (DAU/MAU), data volume (TB/day), traffic (RPS), infrastructure size (pods, nodes, services). Scale signals that your experience is production-grade.
- COST: Infrastructure savings ($K/year), compute reduction (%), licensing eliminations. Financial impact resonates with both engineering managers and executives.
- VELOCITY: Deployment frequency (releases/week), CI pipeline time reduction (minutes), test coverage increase (%), PR cycle time. These signal engineering culture contribution.
- When you cannot find a hard metric: use scope. 'Used by 8 internal teams', 'adopted as the org-wide standard', 'reduced on-call incidents from 12/week to 2/week'.

8.4 Strong Action Verb Bank (SDE)

Architected • Engineered • Designed • Built • Implemented • Shipped • Deployed • Scaled • Optimized • Refactored • Migrated • Automated • Instrumented • Debugged • Integrated • Containerized • Orchestrated • Provisioned • Benchmarked • Open-sourced

8.5 Before vs. After — SDE Bullets

✗ Vague (Never Write These)	✓ Specific (Write These Instead)
Worked on backend APIs for the product	Built 12 REST endpoints (Node.js + PostgreSQL) for the core order management service, reducing client-side data fetching by 60%
Responsible for database optimization	Reindexed 3 high-traffic PostgreSQL tables and rewrote 5 N+1 queries, cutting average API response time from 1.4s to 210ms
Helped migrate services to the cloud	Migrated 4 monolithic services to AWS Lambda + API Gateway, reducing infrastructure cost by $38K/year and eliminating 2 on-call incidents/week
Fixed bugs and improved code quality	Eliminated 220 production bugs across 3 sprints by introducing automated Jest + Supertest coverage from 4% to 81%
Wrote unit tests for the application	Increased unit and integration test coverage from 12% to 79%, reducing production regression incidents by 65% over two quarters
Worked in an Agile development team	Led adoption of 2-week sprint cadence for a 6-engineer team, improving on-time delivery rate from 54% to 91% over two quarters

8.6 Demonstrating Seniority Through Bullets

- Junior: 'Built X feature using Y technology' — shows execution ability.
- Mid-level: 'Designed and built X, improving Y by Z%' — shows ownership and impact.
- Senior: 'Defined architecture for X, led 3-engineer squad to deliver in 6 weeks, reducing Y by Z%' — shows leadership, design judgment, and measurable delivery.

- Staff/Principal: 'Set technical direction for X across 4 teams, establishing org-wide standard that reduced Y by Z%' — shows org-level influence.
- The gap between junior and senior bullets is not the vocabulary — it's the scope of ownership expressed.

PART 9 — PROJECTS (SDE / Cloud)

9.1 When & How to Include Projects

- Include for: freshers, bootcamp graduates, and career switchers — or when your work experience doesn't demonstrate a key skill from the JD.
- Experienced engineers (4+ years): only include projects that are genuinely differentiated — open-source libraries with GitHub stars, tools adopted by other teams, or production systems with real users.
- Maximum 3 projects. Each needs a name, stack, a problem it solved, and an outcome.
- GitHub link must go to an active repo with a proper README and real code — never an empty or 3-commit repo.

9.2 Project Entry Format

Project Name | Python, FastAPI, PostgreSQL, Docker, AWS EC2 **github.com/username/project**

Built a personal finance API that aggregates transactions from 3 bank feeds and auto-categorizes spending using a rule-based NLP classifier.

Designed the database schema (PostgreSQL), containerized the app (Docker), and deployed on AWS EC2 behind an Nginx reverse proxy.

250+ active users, 98.6% uptime over 6 months; 180 GitHub stars.

9.3 High-Signal vs. Low-Signal Projects

✗ Low Signal	✓ High Signal
To-do list app (React + local storage)	CLI tool that automates your own workflow — real problem, real use
Weather app using an open API	Distributed rate limiter implemented from scratch in Go
Netflix clone (UI only, no backend)	Browser extension with 1K+ active users on Chrome Web Store
Tutorial project followed step-by-step	Contribution to an open-source project with merged PRs
Empty GitHub repo with 2 commits	API with real users, real data, and deployment history
